

ABRA Update #90 – July 28, 2016

Hundreds Protest Governor McAuliffe's Energy and Environment Policies

More than 600 people from throughout Virginia converged in Richmond July 23 to voice their disappointment with Governor McAuliffe's policy positions and actions (or inactions) on natural gas pipelines, water quality, energy justice and several other environmental issues. The crowd was undeterred by the 101-degree heat of the day. The event, organized by the Chesapeake Climate Action Alliance, began with a rally on Brown's Island and concluded with a march through downtown Richmond to the Governor's Mansion. Among speakers who addressed the rally regarding the Governor's support for the Atlantic Coast and Mountain Valley Pipelines were Heidi Cochran (Friends of Nelson County), Lew Freeman (ABRA), Carolyn Reilly (Franklin County, Blue Ridge Environmental Defense League) and Rick Shingles (Giles County, POWHR Coalition). The March was preceded by a [June 15 letter to Governor McAuliffe](#) signed by 60 Virginia environment and conservation groups, including ABRA and several of its members.

Proposed Pipelines Threatened U.S. Climate Change Goals

A [new report released on July 22](#) states that “the currently planned gas production expansion in Appalachia would make meeting goals impossible.” The report, *A Bridge Too Far: How Appalachian Basin Gas Pipelines Expansion Will Undermine U.S. Climate Goals*, was produced by Oil Change International (www.priceofoil.org), a Washington, DC-based research/advocacy organization. Among report highlights are:

- The U.S. Energy Information Administration’s (EIA) latest projection for U.S. gas supply and demand (Annual Energy Outlook 2016) shows a 55 percent increase in production and a 24 percent increase in consumption by 2040. The difference between the greater rise in production than consumption would go to export.
- The rise in gas consumption projected by the EIA would alone lead to emissions that would surpass the current long-term U.S. climate target by 2040, even after accounting for methane leakage cuts.
- The report recommends:
 1. All federal government agencies and departments, including FERC, should apply a climate test in the permitting processes of all fossil fuel infrastructure, including in Programmatic Environmental Impact Statements.
 2. No new natural gas pipeline projects should be considered unless they can pass a climate test. The climate test should be applied to all currently pending and future pipeline applications.
 3. The EIA should provide detailed guidance in its Outlook reports for U.S. fossil fuel supply and demand under various climate goals, including the nation’s long-term climate goal, a 2°C path, and a 1.5°C path.
